

FUMA MACHINERY LIMITED

富迈机械有限公司

High Performance

MZR Compensation Roll

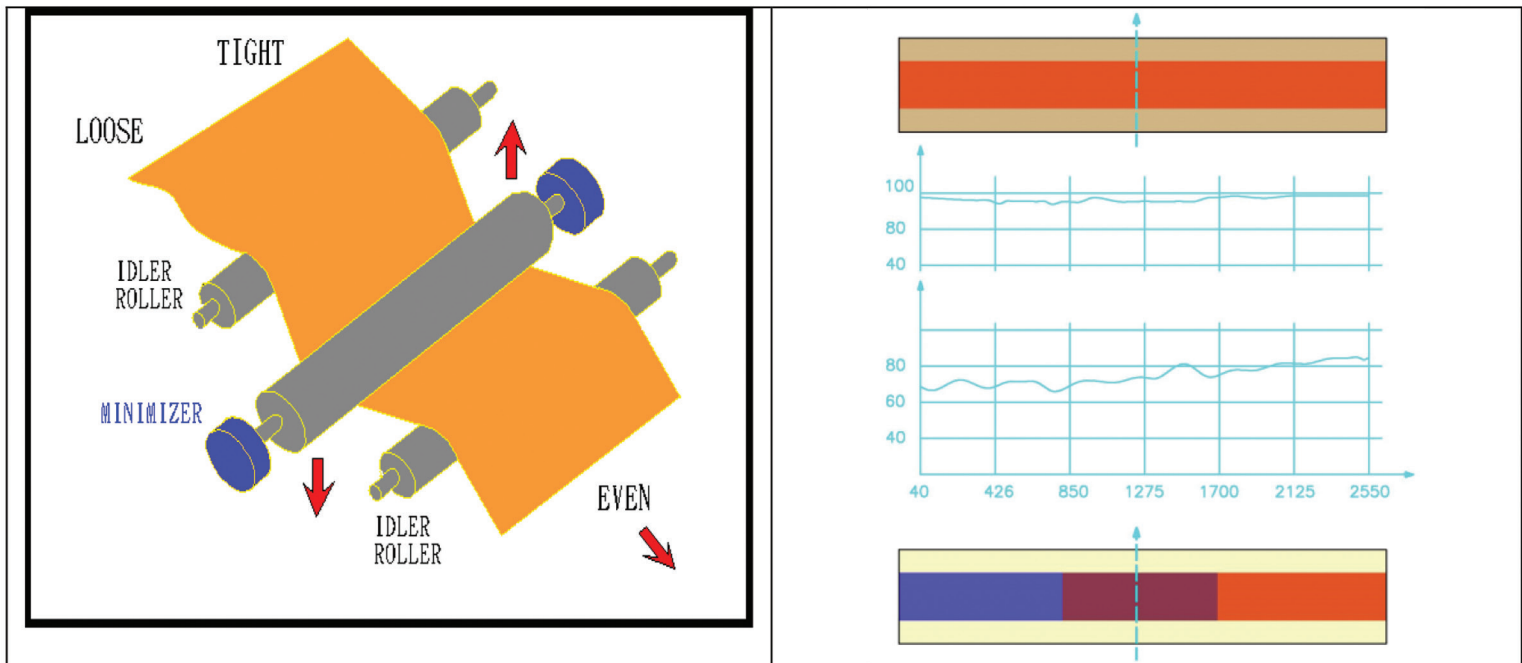

A reliable system which give you excellent returns of investment

Key Features:

- Minimizes waste
- Minimizes High/Lows
- Reduces Downtime
- Reduces Maintenance
- Reduces Warp
- Easy to install
- Reduces Web Breakouts

High Performance

MZR Compensation Roll

Improve Production and Board Qualities

- With even tension on both sides of the paper, stress points at the edges are drastically reduced. Even with the use of automatic splicers, with this tension roll, you could splice in paper rolls which have loose edges and it would quickly adjust to the tension requirements of the new paper roll to prevent the stresses from breaking the web.
- By installing this roll near the preconditioners/preheaters, it ensures even paper web tension prior to contact with the heating surface. With even heating of the paper before it is passed into the singlefacer, this ensures that warp due to uneven heating or uneven tension is drastically reduced.
- By having an even-tensioned paper web passed into the singlefacer, flute formation will be more uniform. Due to this, there will be uniform glue application to the tips of the fluting and you could achieve better quality board which are flatter.
- The design of this roll is virtually maintenance free, with no need for constant re-adjustments or complicated part replacements. It's purely mechanical design allows for minimum wear and tear.
- With less waste due to warp and fewer web breakages due to uneven tension, most corrugators can expect to see an improvement in the overall machine productivity.
